

BHĀRAT FOODS

& BEVERAGES CO.

Q2 FY26 National
Sales Review &
Distributor Analytics

Comprehensive review of 30,000+ primary-billing rows, 38,000+ secondary movements, and 800 distributor performance records — with a dual capstone: **Distributor Health Score** (analytics) + **Q3 ₹40 Cr Investment Strategy** (strategy).

Business	Bhārat Foods & Beverages Co. (Mid-cap Indian FMCG, ₹1,200 Cr ARR)
Data Period	April 1 – September 30, 2025 (Q1 baseline + Q2 detail, 183 days)
Volume	~76,000 rows · 22 SKUs · 800 distributors · 50 cities · 4 zones
Focus Areas	Sales diagnostic · Distributor health · Trade-promo ROI · Strategic investment
Capstone	DUAL — Distributor Health Score + ₹40 Cr Q3 Investment Recommendation
Deliverable	Performance deck (12–16 slides) + 2-page Distributor Health methodology note
Suggested Time	~28 hours over 3 weeks
Your Role	Sales Analytics Manager, embedded with the National Sales Director

Project 3 of 20 in the industry-grade case study series. Mirrors the structural pattern of real Sales Analytics roles at HUL, ITC, Britannia, Dabur, Marico, and Tata Consumer. Data is synthetic but modelled on real Indian mid-cap FMCG operations.

How the CEO Reads This Deck

Before you write a single chart, understand who reads it and how. Your CEO has **4 minutes** before their next meeting. They will read your title slide and your executive summary. If they see numbers without strategic meaning, they'll dismiss it. If they see opinions without numbers, they'll dismiss it. **Both, framed as a decision, get acted on.**

◆ The 4-Minute Test

Imagine the CEO walks into a board meeting carrying only your deck. Could they answer **three questions** from your title and exec summary alone?

1. **What happened in Q2?** One sentence. Volume direction, value direction, big surprise.
2. **Why did it happen?** Two reasons, ranked by impact. Not five. Two.
3. **What should we do about it?** One concrete action with a number attached.

★ The Analyst's Mistake You Must Avoid

Junior analysts hand the CEO 14 charts and say 'here's what the data shows.' Senior analysts hand the CEO 3 charts and say 'here's what we should do, and here's the data behind it.' The deck you build for this case must read like the senior version. Every chart you include must be *defendable* — if the CEO asks 'why is this slide in here', you should be able to answer 'because it changes the decision.'

◆ Stakeholder reading patterns

Different stakeholders read your deck differently. Build the deck so each finds what they need:

CEO	Reads page 1 and page 14 (recommendation). Skims the rest. Make those two pages perfect.
CFO	Reads cost and ROI sections carefully. Will challenge any number that lacks a source.
NSD (Sales)	Reads the distributor and zone sections in detail. Will challenge any insight with operational implications.
Category Heads	Look only at their category. Build category breakouts they can extract.
Board members	Read the executive summary and a single chart. Make sure both tell the truth.

Objective

You have just joined Bhārat Foods' Sales Analytics team at HQ Mumbai. The Q2 FY26 numbers have closed and the National Sales Director (NSD) wants a comprehensive review for next month's board meeting. The task has **three clear deliverables**:

1. **Diagnose Q2 performance.** What happened across categories, channels, geographies, and distributor segments — versus Q1 baseline and benchmarks. Where are the wins, the losses, and the surprises?
2. **Build a Distributor Health Score (analytics capstone).** Rank all 800 distributors on a 0–100 composite score from raw operational data. Identify the bottom 50 at-risk distributors and recommend interventions.
3. **Recommend Q3 investment strategy (strategy capstone).** The CEO has approved ₹40 Cr for Q3 distribution investment. You decide the split between defending at-risk territories and expanding into new ones — and defend that split in the board meeting.

The CEO will read your executive summary. The CFO will interrogate your trade-promo math. The NSD will challenge your distributor scorecard. The Category Heads will defend their categories. Build a deck that answers all four, without being a 30-slide data dump.

Materials Provided

1. **SKU_Master** — 22 products across 4 categories: Biscuits · Snacks · Beverages · Health Foods. MRP, COGS, billing prices, target margins.
2. **Distributors** — 800 distributor records with location, tenure, credit terms, channel type (GT vs GT+MT), categories handled, last ASM visit, last training year.
3. **Primary_Sales** — 30,000+ rows. Company → distributor billing across 6 months. Includes credit days, actual payment days (the late-payment signal).
4. **Secondary_Sales** — 38,000+ rows. Distributor → retailer movement across Q2. Broken down by retailer segment (Kirana / MT / E-Com / Wholesale).
5. **Returns** — ~5,500 returned-stock records. Reason categorized (Near Expiry, Damaged, Slow Moving, Quality Complaint, etc.).
6. **Trade_Schemes** — 94 promotional schemes run during Q2 with cost, mechanic, discount %, target volume, applicable SKU.
7. **City_Demographics** — 50 cities with population, income mix, retail outlets, Bhārat Foods penetration, competitor intensity, Modern Trade share, per-capita FMCG spend. *Used for the strategic capstone.*
8. **Benchmarks** — 16 FMCG industry benchmarks for sales growth, distributor health, trade promotion ROI, distribution quality.

❖ Read this BEFORE you open the workbook

The data is **intentionally messy** — it mirrors a real DMS export. You will find: (1) **Mixed date formats** in the same column — 2025-07-15, 15/07/2025, 07/15/2025, and datetime objects all coexist. (2) **State spelling variations** — *Maharashtra*, *MH*, *Mahar.*, *MAHARASHTRA*, and *maharashtra* all refer to one state. (3) **City variations** — *Bangalore* / *Bengaluru* / *BANGALORE* / *Bombay* / *Calcutta*. (4) **\N and null placeholders** on ~1-2% of cells. (5) **Numeric values stored as text** in some cases. **Cleaning is part of the grade — 8% of total marks.**

Business Context · Why Q2 Matters

Bhārat Foods & Beverages Co. is a 35-year-old mid-cap Indian FMCG company headquartered in Mumbai. The portfolio spans 22 SKUs across four categories — **Biscuits** (35% of revenue, the foundation), **Snacks** (25%), **Beverages** (20%, with a strong summer skew), and **Health Foods** (10%, a new category launched in FY25 and the strategic bet for the next decade). ARR is ~₹1,200 Cr.

Distribution runs through ~800 distributors across 50 cities and 4 zones (North, West, South, East), feeding ~4 lakh retail outlets. The channel mix is still ~**70% General Trade** (kirana stores), with Modern Trade (BigBasket, DMart, Reliance Smart) and E-Commerce (Amazon, Flipkart, Quick Commerce) growing fast.

Q2 FY26 (Jul-Sep 2025) is a **pivotal quarter**. The NSD has signalled three concerns to the CEO: (a) primary growth is healthy at the top line, but secondary sell-through to retailers has weakened — distributors may be stocking faster than they're selling; (b) the new Health Foods category looks great in headline numbers, but trade-promo spend has surged to support it — is the demand real?; (c) competitive pressure has intensified in a few South India states for the Beverages portfolio.

Management's Stated Questions for You

① What's the real story behind Q2 — is the growth healthy or propped up? ② Which distributors are at risk of going bad — and how do we save them before they do? ③ Are our trade-promo investments earning back? Which schemes should we double down on, kill, or rework? ④ **How should we deploy the ₹40 Cr Q3 investment budget — defend existing territories or expand into new ones?**

Your Stakeholders

Role	Primary Concern	What They'll Ask
CEO	Q2 health and Q3 plan	"What's the one number that defines Q2, and where do we put the ₹40 Cr next?"
NSD (Sales)	Distributor and channel performance	"Which 50 distributors do I rescue and which do I replace?"
CFO	Trade-promo ROI and credit risk	"Of the ₹78 Cr we spent on schemes, how much was burned? Where's our credit exposure?"
CMO	Brand and category narrative	"What's the real Health Foods story — is the demand real or borrowed from promotions?"
Category Heads	Their category's growth and health	"Where does my category stand vs the others? What's my Q3 ask?"

The Analysis · What Your Deck Must Cover

Five layered questions. Each builds on the previous. **Don't skip the diagnostics to get to the capstones** — your scorecard and strategy will be weaker if you don't first understand the underlying performance story.

► 1. Sales Performance Diagnostic — Where Did Q2 Actually Land?

Calculate Q2 vs Q1 growth across multiple cuts. The headline 'Q2 grew 8%' hides several stories — find them.

- a. **By category.** Growth for Biscuits, Snacks, Beverages, Health Foods. Which is propping up the headline number? Which is dragging?
- b. **By channel.** GT (kirana) vs GT+MT distributors. Is Modern Trade growing materially faster than General Trade? Quantify the gap.
- c. **By zone and city tier.** Tier-1 vs Tier-2/3. Where is real growth happening vs where it's saturating?
- d. **Primary vs Secondary sales gap.** What is the company-billing-to-retailer-movement gap? A widening gap means stocking-without-selling — a serious leading indicator.
- e. **SKU-level winners and losers.** Which 5 SKUs grew most? Which 5 declined?

► 2. Trade Promotion ROI — Are We Burning Money?

Bhārat Foods spent ₹78 Cr on 94 schemes in Q2. Did it earn back? Industry benchmark: 2.5x ROI.

- a. **Per-scheme ROI.** Calculate incremental sales lift ÷ scheme cost for each of the 94 schemes. Rank them.
- b. **Negative-ROI schemes.** How many destroyed value (ROI < 1.0x)? How many were below benchmark (ROI < 2.5x)? What's the total wastage in rupee terms?
- c. **By category.** Which category has the best/worst average promo ROI? Is any category systematically promo-dependent?
- d. **By scheme type.** Volume Discount vs Buy-N-Get-M vs Display Allowance vs Consumer BOGO — which mechanic earns back most reliably?
- e. **Recommendations.** Which schemes to scale, which to redesign, which to kill. Estimate Q3 savings if poor schemes are eliminated.

The Analysis · continued

► 3. Distribution Quality — Are All 800 Pulling Their Weight?

Foundational diagnostic before the Distributor Health Score capstone. Build the operational view first.

- a. **Distribution metrics.** Compute outlet coverage, avg lines per outlet (range-selling), return rate per distributor.
- b. **Payment behaviour.** How many distributors are systematically late? Where is credit exposure concentrated — small distributors or large ones?
- c. **Stock-vs-sell pattern.** Calculate secondary-to-primary ratio per distributor. How many are below 0.70 (red flag)? Below 0.50 (critical)?
- d. **ASM coverage.** Are weakly-performing distributors getting ASM attention or being ignored? Plot last-visit-days against performance.
- e. **Geographic patterns.** Are bad distributors concentrated in any zone or tier? Could there be a regional management problem?

★ Capstone 1 of 2 — Question 4: Distributor Health Score

Build a 0–100 composite Distributor Health Score for every one of the 800 distributors, validated against historical 'bad distributor' outcomes hidden in the data. Output the bottom-50 at-risk list with intervention recommendations.

- a. **Feature engineering.** From the 8 sheets, construct per-distributor features: secondary-to-primary ratio, average payment-days-overdue, range-selling % (SKUs actively moving / SKUs handled), return rate, last ASM visit, last training year, tenure, credit utilization.
- b. **Weight features.** Use a weighted-sum scorecard (SUMPRODUCT in Excel). The right weights aren't given — derive them. Look at distributors who have deteriorated the most across Q1→Q2 and reverse-engineer which features predict it best. *Hint: secondary-to-primary ratio is the single most predictive feature, but no single feature should dominate.*
- c. **Score every distributor.** 0–100 scale. Tier them: Healthy (75+) / Watch (50–74) / At-Risk (30–49) / Critical (<30). Show the distribution.
- d. **Generate reason strings.** For each at-risk distributor, write a one-line reason — 'Shree Traders, Indore: CRITICAL — secondary-to-primary 0.51, payment 22 days late, return rate 6.8%.' No reason = no retention action.
- e. **Validate.** Define a 'bad distributor' (e.g., return rate >5% AND payment overdue >15 days) and check what % of your bottom-50 list overlaps. Aim for >50% precision at the bottom decile.
- f. **Recommend interventions per tier.** HEALTHY → reward and grow. WATCH → ASM review. AT-RISK → 60-day improvement plan. CRITICAL → terminate or restructure. Quantify cost and expected exposure-saved for each.

◆ Why the secondary-to-primary ratio matters

An FMCG distributor failure shows financial symptoms **only when it's almost too late**. The strongest *leading* signal is operational: **distributor billing volume held flat while sell-through to retailers dropped**. That's the secondary-to-primary ratio falling below 0.70. By the time payment days slip, the relationship is already 6 months gone. Students who only look at financial signals will miss the turn. Students who understand FMCG ops will catch it.

★ Capstone 2 of 2 — Question 5: Q3 ₹40 Cr Investment Strategy

Take your Question 4 health-score findings PLUS your Question 1 sales diagnostic and translate them into a strategic investment recommendation. The CEO will fund whichever path you defend most credibly.

The CEO has authorised **₹40 Cr for Q3 FY26 distribution investment**. You decide the split across two paths and defend it. There is no 'right' answer — but there are *well-defended* answers and *poorly-defended* ones. Your rubric weights this 17% of grade.

- a. **Defensive path — Save existing territories.** Estimate the cost and expected impact of intervening on AT-RISK and CRITICAL distributors. Training, ASM redeployment, credit restructuring, scheme retargeting, distributor replacement. How much exposure can you save per ₹ spent?
- b. **Offensive path — Expand into new cities.** Use the City_Demographics sheet to score the 50 cities on multiple criteria: market potential (population × per-capita FMCG spend), current Bhārat Foods penetration, competitive intensity, modern-trade share, execution feasibility. Which 25 cities should get expansion investment? In what mix (Tier-2 deep coverage vs Tier-3 entry)?
- c. **Pick a split.** ₹40 Cr broken across defensive vs offensive. Be specific: *e.g. "₹22 Cr defensive (₹10 Cr distributor remediation + ₹12 Cr trade-promo redesign) + ₹18 Cr offensive (₹14 Cr Tier-2 expansion + ₹4 Cr Tier-3 entry)"*.
- d. **Quantify expected ROI on both paths.** Defensive path: ₹X invested protects ₹Y of LTV. Offensive path: ₹X invested generates ₹Y new revenue over 18 months.
- e. **Defend it to the CEO.** In one slide, lay out: the split, the logic, the expected ROI, and the major risks. Anticipate the CEO's pushback and address it in your speaker notes.

★ This is where analysts become strategists

Anyone who can build a distributor scorecard in Excel is an analyst. The person who can take that scorecard, combine it with market data, and walk into a board meeting saying '*fund this split, decline this one, here's why*' — is the person who gets promoted to senior analyst, then to manager, then to head of department. Question 5 is your audition for that career arc. Take it seriously.

Interface Reference · The Tools FMCG Analysts See Daily

The three screens below are representative of what an FMCG analyst at Bhārat Foods sees in their **DMS (Distributor Management System)**. You won't directly use these, but the views they generate are the ones your deck must reproduce in spirit.

DMS Sales Overview — the NSD's home page. Top-line KPIs, zone performance, top distributors, alerts requiring attention. This is the executive view your deck's first slide should resemble.

Distributor Health Scorecard — what a single distributor's health-score card should look like. This is the output format for your Capstone 1 (Question 4) — apply this structure to your bottom-50 list.

Trade Promotion Tracker — the scheme ROI view. Each promotion shown with its spend, incremental sales, ROI, and status. Use a similar table for your Question 2 deliverable.

Metrics Required by Focus Area

Below is the minimum metric coverage expected per focus area. Go deeper where the data invites you.

■ Sales Performance

Metric	Formula / Definition	Why It Matters
Primary Sales Value	Σ (billed_value_inr) by period	Top-line company revenue
Primary Sales Volume	Σ (billed_cases)	Volume health independent of price/mix
Secondary Sales Value	Σ (secondary_value_inr) by period	What actually moved to retailers
Sec/Primary Ratio	Σ Secondary $\div$ Σ Primary (same period)	Sell-through health — leading indicator
YoY / QoQ Growth %	$(\text{Period A} - \text{Period B}) \div \text{Period B} \times 100$	Direction and magnitude
Channel Mix %	Channel sales $\div$ Total	Where's the volume — GT, MT, E-Com

■ Distribution Quality

Metric	Formula / Definition	Why It Matters
Outlet Coverage (Numeric)	Outlets billed $\div$ Total reachable outlets	Quantity of penetration
Range Selling %	SKUs actively sold $\div$ SKUs handled	Quality of penetration
Avg Lines per Outlet	Total SKUs sold $\div$ Outlets billed	Depth of relationship
Return Rate %	Return value $\div$ Primary value	Stocking discipline
Avg Payment Days	Mean of actual_payment_days	Cash flow health
Payment Overdue Days	$\text{actual_payment_days} - \text{credit_days_terms}$	Late payment severity

Metrics · continued

■ Trade Promotion ROI

Metric	Formula / Definition	Why It Matters
Scheme Spend	Direct from Trade_Schemes sheet	Total investment in the scheme
Incremental Sales	Sales during scheme – Baseline sales	True uplift
Trade-Promo ROI	Incremental Sales ÷ Scheme Cost (multiple)	The headline ROI metric
Negative-ROI Schemes	Count of schemes with ROI < 1.0x	Wasted investment
Below-Benchmark Schemes	Count of schemes with ROI < 2.5x	Underperforming portfolio
Promo Dependency	Promoted volume ÷ Total category volume	How much demand is borrowed

■ Distributor Health Score (Capstone 1)

Component	Why It Matters	Suggested Weight
Sec/Primary Ratio	Best leading indicator of distributor failure	25–35%
Payment Overdue Days	Direct cash-flow risk	20–25%
Range Selling %	Active vs passive distributor	15–20%
Return Rate %	Stocking discipline	10–15%
Last ASM Visit / Training	Relationship maintenance	5–10%
Tenure / Credit Utilization	Stability & exposure	5–10%

■ Strategic Investment (Capstone 2)

Component	Used For	Source
Market Size (₹Cr)	Sizing the city opportunity	City_Demographics: population × per-capita FMCG
Current BF Penetration	Headroom in the city	City_Demographics: bharat_foods_penetration
Competitor Intensity	Difficulty of expansion (1-5)	City_Demographics: competitor_intensity_1to5
Modern Trade Share	MT-friendly cities for our GT+MT distributors	City_Demographics: modern_trade_share
Defensive ROI	₹ exposure saved ÷ ₹ intervention cost	Derived from Capstone 1 outputs

Benchmarks Appendix

Industry benchmarks for comparing your Q2 numbers. Source: blended FMCG industry averages (India, Q1 FY26). Use these to build a green/amber/red scorecard.

Area	Metric	Benchmark	Direction
Sales Growth	QoQ Volume Growth	6%	↑ Higher better
Sales Growth	QoQ Value Growth	9%	↑ Higher better
Sales Growth	Modern Trade Share of Total	~22%	↑ Rising
Distributor Health	Secondary-to-Primary Ratio	≥0.85	↑ Higher better
Distributor Health	On-Time Payment %	85%	↑ Higher better
Distributor Health	Range Selling %	65%	↑ Higher better
Distributor Health	Return Rate	≤3.5%	↓ Lower better
Trade Promotions	Avg Trade-Promo ROI	2.5x	↑ Higher better
Trade Promotions	Schemes with Negative ROI %	≤25%	↓ Lower better
Distribution	Outlet Coverage	65%	↑ Higher better
Distribution	Avg Lines per Outlet	8	↑ Higher better
Channel	General Trade Share	~70%	Stable
Channel	E-Commerce Share	5-7%	↑ Rising
Geography	Tier-2/3 Growth Premium vs Tier-1	1.4x	↑ Higher better
Inventory	Distributor Stock Days	21 days	↓ Lower better

▲ Benchmarks ≠ Targets

Context matters. A 0.65 sec/primary ratio in a distributor handling Modern Trade (where MT carries higher inventory days) is different from 0.65 in a kirana-only distributor. Where benchmarks are missed, the interesting question is *why* — channel mix, category mix, tier — not just the gap itself.

Tips From Your Senior Analyst · Read Before You Start

◆ Suggested workflow (3 weeks ≈ 28 hours)

Don't try to build everything at once. Layer the analysis. Skip layers and your scorecard will be weaker.

Week 1 — Clean and diagnose		Unify dates, normalize state/city names, handle \N. Build Q1 vs Q2 views by category, channel, tier, zone. ~10 hrs.
Week 2 — Trade promo distribution	+	Per-scheme ROI calculation. Distribution quality views. Identify which distributors are on the edge. ~10 hrs.
Week 3 — Capstones deck	+	Build the Distributor Health Score. Score 800 distributors. Build the Q3 investment recommendation. Then construct the deck. ~8 hrs.

★ Hints hiding in the data

- **Modern Trade is winning.** GT+MT distributors are growing roughly 3–4× faster than GT-only distributors. Find this gap, quantify it, and ask: should Bhārat Foods invest more in onboarding GT distributors to MT capability?
- **Tier-2/3 is the growth story.** Tier-1 cities are growing modestly (~5%). Tier-2 and Tier-3 are growing 4–5× as fast. This shapes your offensive investment recommendation in Q5.
- **Health Foods looks great. Look closer.** The +79% growth headline is real, but the trade-promo discount on Health Foods is 1.6× higher than other categories. *How much of the growth survives if the promo is removed?* This is the question the CMO is afraid you'll ask.
- **The Beverages story is geography-specific.** Aggregate Beverages is roughly flat. But four South India states (Tamil Nadu, Karnataka, Kerala, Andhra Pradesh) show steep Aug→Sep declines. Something specific is happening there. The data won't tell you what — but the pattern is discoverable.
- **Sec/Primary ratio is the leading indicator.** Most distributors below 0.70 will deteriorate in Q3. Most above 0.85 will stay healthy. Build your scorecard around this insight.
- **Late payment isn't where you'd guess.** The most-overdue distributors are not the smallest — they tend to be larger, with credit limits above ₹30L. This concentration risk is worth a slide for the CFO.

◆ Capstone design principles (both)

For the Health Score: (1) Explainability beats accuracy — a weighted-sum scorecard the NSD can read beats a fancy regression nobody trusts. (2) No single feature should dominate (max ~30% weight). (3) Validate on outcomes — define 'bad distributor' operationally and check overlap. (4) Every score needs a one-line reason string. **For the Strategic Recommendation:** (5) Pick a split and own it. ₹20/₹20 is rarely right. (6) Quantify both paths in rupee terms. (7) Anticipate CEO pushback in your speaker notes. (8) Apply an execution-feasibility lens.

Final Deliverable · What to Submit

Submit a **12-16 slide presentation** + a **2-page Distributor Health Score methodology note**. Optionally include your Excel workbook as supporting material.

Slide	Content	Notes
1	Title + Executive Summary	3 headlines the CEO will remember
2	Q2 at a Glance	Volume / value / growth scorecard vs benchmarks
3-4	Sales Diagnostic Deep-Dive	Category, channel, zone, tier, sec/primary
5	Trade Promotion ROI Analysis	Top/bottom schemes + recommendations
6	Distribution Quality Snapshot	Coverage, range-selling, payment, returns
7	Distributor Health Score — Methodology	Features, weights, validation
8	Top-50 At-Risk Distributors	Tiered list with reason strings
9	Q3 Investment Recommendation	₹40 Cr split + defensive/offensive logic
10-11	Defensive Plan	Distributor remediation cost & impact
12-13	Offensive Plan	City prioritization, expansion ROI
14	Stakeholder Recommendations Summary	CEO / CFO / NSD / CMO / Category Heads
15	Appendix	Methodology, assumptions, caveats

Evaluation Rubric

Dimension	Weight	What Excellence Looks Like
Data Handling	8%	Cleans messy data without losing rows. Documents every cleaning rule. Reconciles primary vs secondary sales correctly.
Diagnostic Depth (Q1–3)	17%	Goes beyond aggregate growth into category × channel × tier breakdowns. Spots non-obvious patterns (Health Foods promo dependency, Tier-2/3 premium, South India beverages cannibalization).
Distributor Health Score Quality (Q4)	18%	Well-engineered features. Sensible weighting. Reason strings. Hold-out validation precision > 50% at bottom decile.
Strategic Recommendation Quality (Q5)	17%	Defensive and offensive paths quantified. Specific ₹ split with logic. Anticipates CEO pushback. Executable not theoretical.
Stakeholder-Aware Communication	15%	Each stakeholder finds what they need (CEO summary, CFO ROI math, NSD operational detail, CMO category narrative).
Storytelling & Deck Design	10%	Clean deck. Every chart has a so-what title. Charts labeled, benchmark-referenced. Exec summary survives the 4-minute test.
Cross-Cutting Analytics ↔ Strategy Integration	15%	Analytics findings inform the strategic recommendation explicitly. A great Distributor Health Score that doesn't influence the ₹40 Cr split = lost integration points.

★ A parting note

The hireable analyst at HUL, ITC, Britannia, or Tata Consumer is the one who can do both: build a defensible Distributor Health Score AND tell the CEO where to put the next ₹40 Cr. An analyst who can do only the first is a junior. An analyst who can do only the second is a consultant. The students who do both — and connect them — get hired into the senior tracks. Take this case as your audition for that career arc. Good luck.

Data is synthetic, structurally modelled on real Indian mid-cap FMCG operations. This case is for educational purposes only. Any resemblance to actual brands is coincidental.
